Explanation of this "Percent Correct" Aptitude Score

The scoring for tests like this one is based on a "percent correct" calculation which is total number of correct answers divided by total number of questions on the test. The candidate has ample time to complete each question, so it is possible to achieve a 100% score.

Lower scores suggest the candidate will make a high number of errors on the job. Their basic skills in this topic area are probably lacking. If hired, you need to consider on-the-job training in this topic area.

Higher scores suggest the candidate is less likely to make mistakes of this type on the job. Their skills are adequate to good, so they can probably improve accuracy as they practice tasks on the job - especially if you give them feedback about errors as they occur during job performance.

We offer the following guideline:

0% to 50% correct	51% - 70% correct	71% to 85% correct	86% to 100% correct
Low Score	Below Average	Above Average	High Score

Most companies are simply trying to weed out candidates who would have the most trouble handling job tasks of this nature. If that is the case, you need to think about what is the lowest "Percent Correct" score you will tolerate. If errors are not particularly costly to your operations, then you may be able to accept candidates who score in the Below Average range.

Some companies are trying to enhance the overall quality of their workforce with the use of standardized aptitude testing. If this is the case for your company, then we advise that you accept candidates in the Above Average or High categories. If errors of this nature cause very serious problems in your company, then you should only hire people who score in the High category.
